The origins...

The house is a basic and fundamental part of urban living. Its origins are pre-historic. Indeed our ancestors who needed shelter, utilised natural resources, such as caves for homes. For a long time, the main building blocks were derived from nature; thus homes were natural and temporary in nature. As civilisation developed, people started to influence their own environments. Creating man-made landscapes as we know today. The building of modern homes today involves the tearing up a green areas and replacing them with concrete foundations.

Garden...

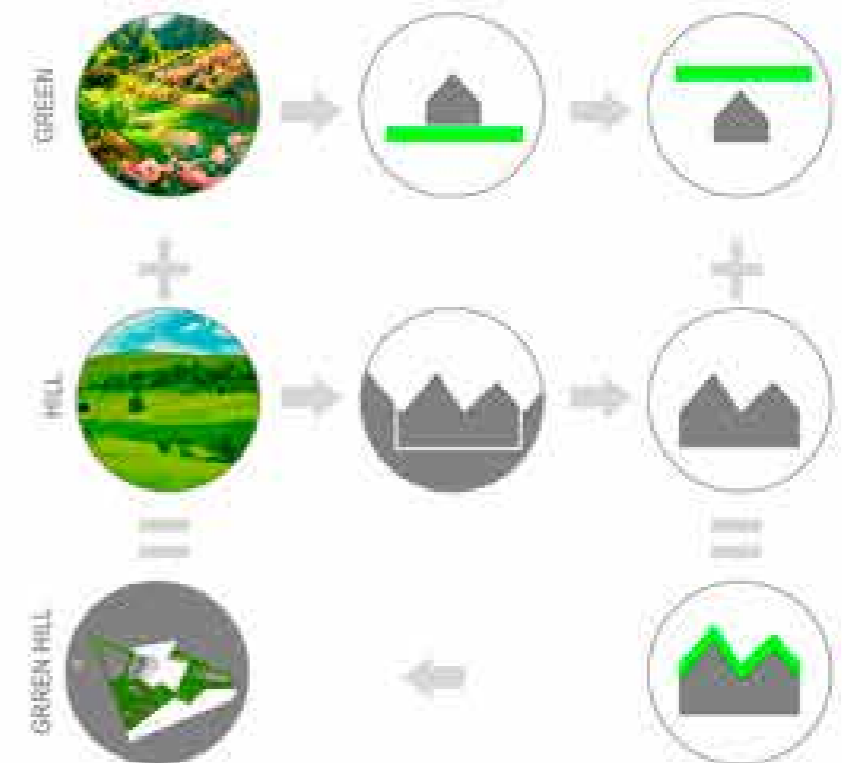

Ever since there have been homes, there have been Gardens. Whenever the weather permits, people spend their free time outdoors, gathering food, working or resting. Gardens in contemporary households have a more decorative character, trying to bring nature into the family environment. The gardens are normally created in the immediate vicinity of the house.

Living house...

Livinghouse is a basic living unit, which has a real impact on the surrounding area and the people using it. Therefore, in an interactive way it affects us all. As an example, it uses the natural environment to create an ecosystem. Livinghouse is trying to give back what it takes from nature, by creating a living breathing garden which covers the entire structure. It is a garden in its own right. The roof in the shape of a mountain effective lighting for the living space, as well as roof space for solar panels. The energy-saving systems make the house more eco-friendly.

Living house...

It can be located in an area of nature, where it attempts to blend into the background. It can also be located in cities by creating a new urban structures, such as terraced houses or other unique developments. Livinghouse aims to inspire people to see their home as a living organism.
